

## Workshop I by Julia Källberg

### Peer Review

Nice model, but a bit confusing with the “three models” concept. Although we in this group understand the concept of your model, a boatclub owner may not.

We as a group think this model pass as a grade 2 criteria, since there are content missing for a higher grade. Such as treasurer, for example.

#### Here is our feedback...

You have divided your domain model into three models, which is a bit confusing.

Our guess is that Authenticate is independent while BoatClubCalendar and BoatGrejor is combined, where the “**Member**” is a central class.

We think that the model looks a bit cluttered with all the lines, maybe you could trim or merge some of the lines? For example, **Member - Boat**. These three lines could be combined into one called something like “Manage->”, same goes for **Secretary - CalendarEvent**.<sup>1</sup>

Does **CalendarEventList**, **CalendarEvent** and **Calendar** need to be three separate conceptual classes? Wouldn't it be easier to have one **Calendar** class with “**Event**” as attribute?<sup>2</sup>

In the “**Authenticate**” model, you think too much about how the “system” actually is going to work. An example is, “the user “**GetAskedFor**” “**LoginInformation**”. Think as a map-maker and not how it is going to work in a system.”<sup>3</sup>
